

Unlock the treasure of information scattered throughout your organization

Problem

Is your strategic business information distributed across disparate data stores and still residing in multiple local databases or applications?

Is your organization expending unnecessary resources and dollars compiling useful information, such as profitability, from such diverse data stores?

Would rapid access to important information from these diverse data stores provide opportunities for cost savings or revenue enhancement? Or help with regulatory requirements?

Solution

NetTeam's solution provides integrated information for effective operational and strategic management. Our adaptive two-step approach can be tailored to your information needs. First, information flows automatically from underlying systems including ERP, CRM, data warehouses, legacy systems and other applications or data stores. In the second step, our methodology utilizes these data stores and underlying applications and "web-enables" them to an enterprise-class platform. This allows your company to leverage its existing IT investments, as data from existing systems is combined to equip you with the information needed to effectively compete in the marketplace.

Step 1: Data integration

Step 2: Web enablement
